UNIT 2: Lesson 6

Working with Presentation Applications

Learning Outcomes

At the end of the lesson, the students should be able to:

1. Design effective multimedia presentations using presentation software;
2. Incorporate multimedia, hyperlinks, charts, and animations appropriately; and
3. Deliver and share presentations using online collaboration tools.

OVERVIEW OF POWERPOINT

- It is used to organize and present text, graphics, and other media as a slide show.

- A digital tool used to create and show visual presentations — often made up of a series of slides containing text, images, charts, videos, and animations.

NWU

PRESENTATION SOFTWARE

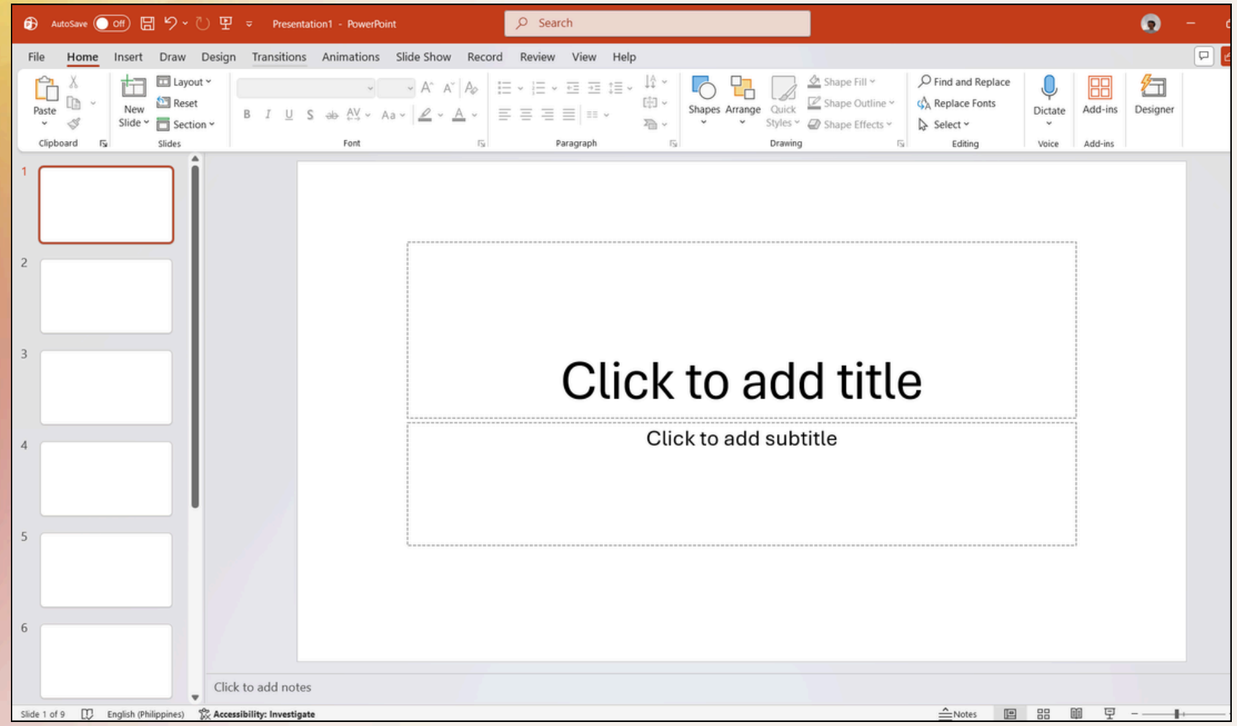

- It is a program used to create visual aids for communication, typically in the form of slideshows.

Examples of spreadsheets application

- Microsoft Powerpoint
- Google Slides

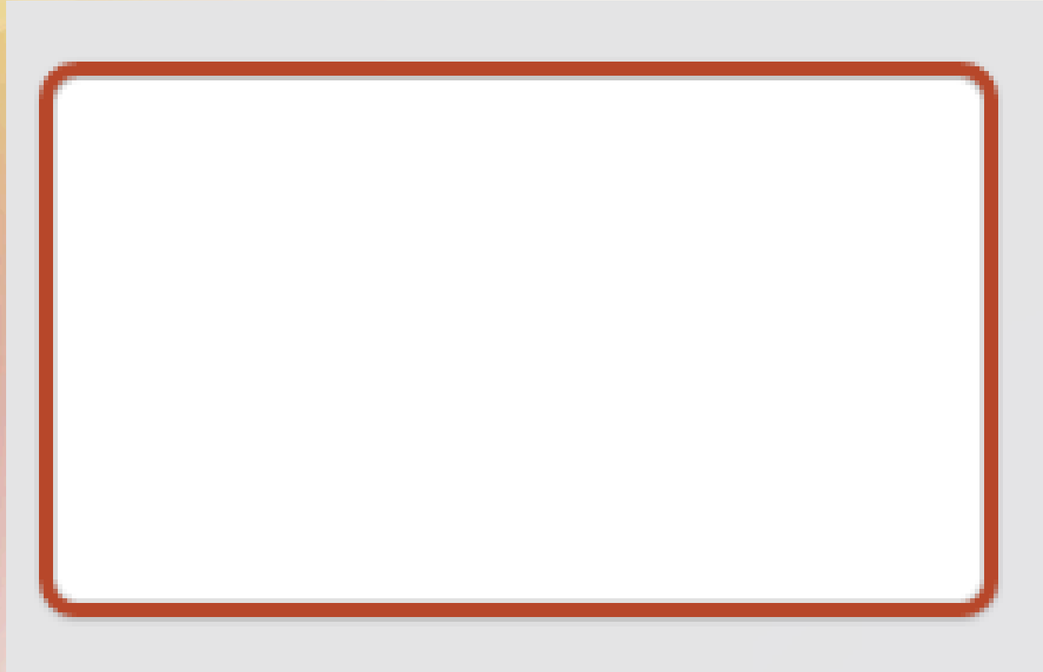

PARTS OF THE POWERPOINT

PRESENTATION

- It is a collection of individual slides for an onscreen display of information and graphics.

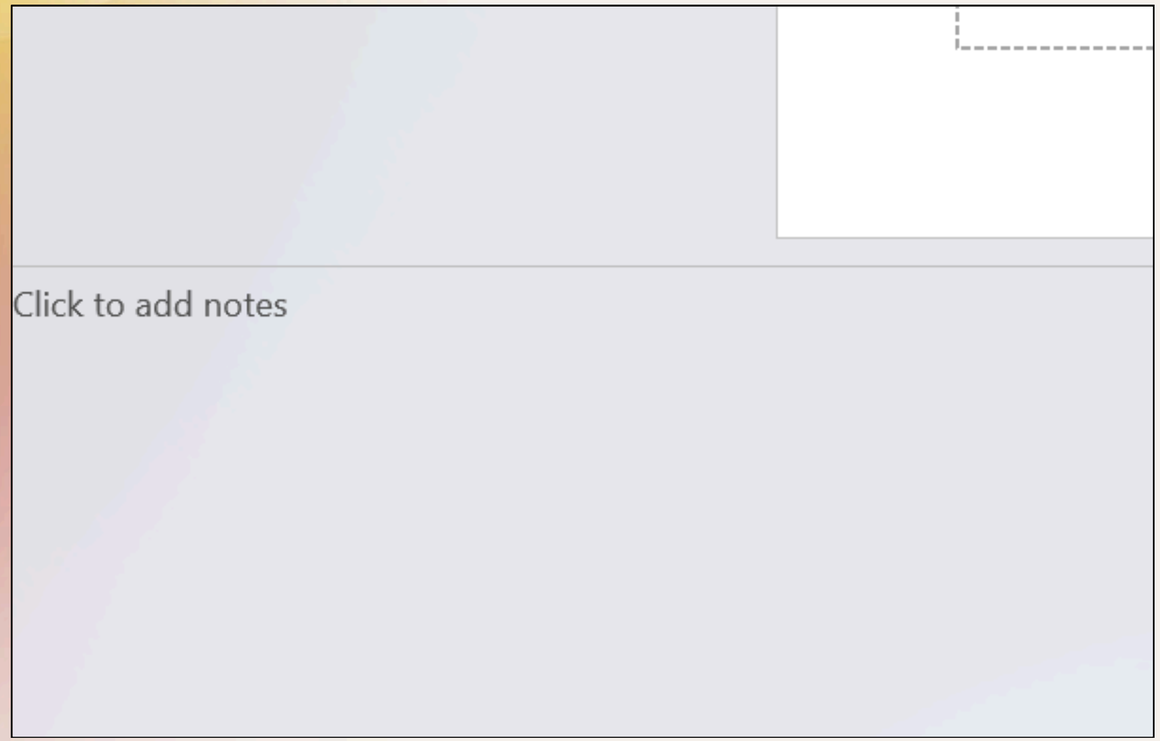

PARTS OF THE POWERPOINT

SLIDE

- It is a single page of a presentation.

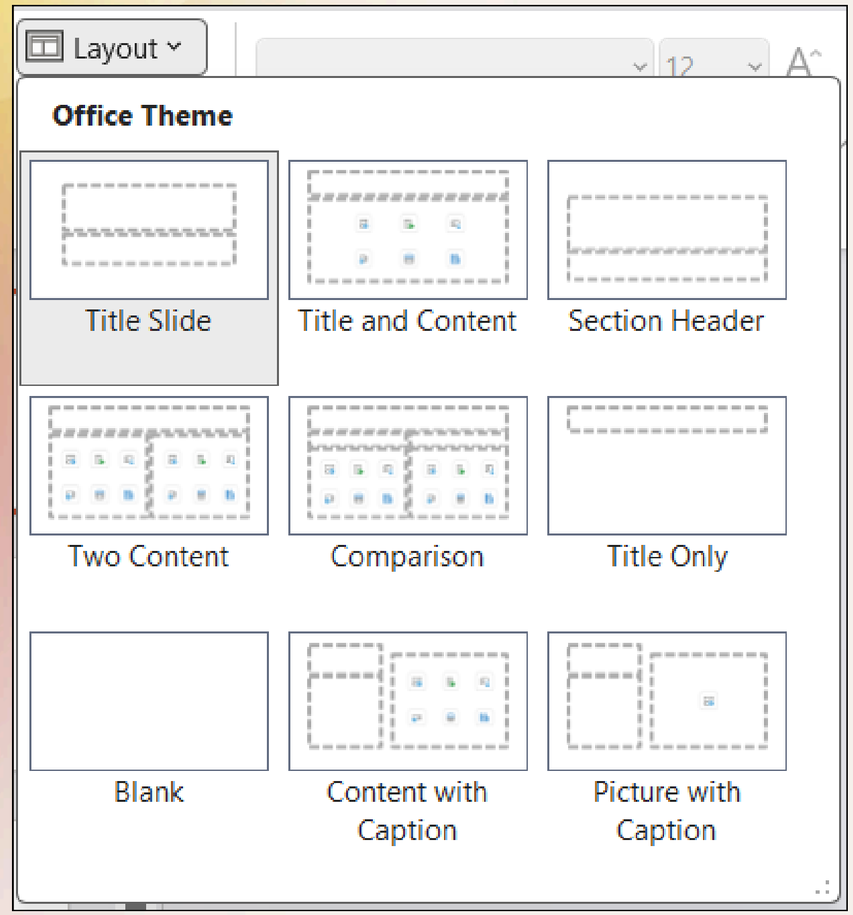

PARTS OF THE POWERPOINT

Notes Pane

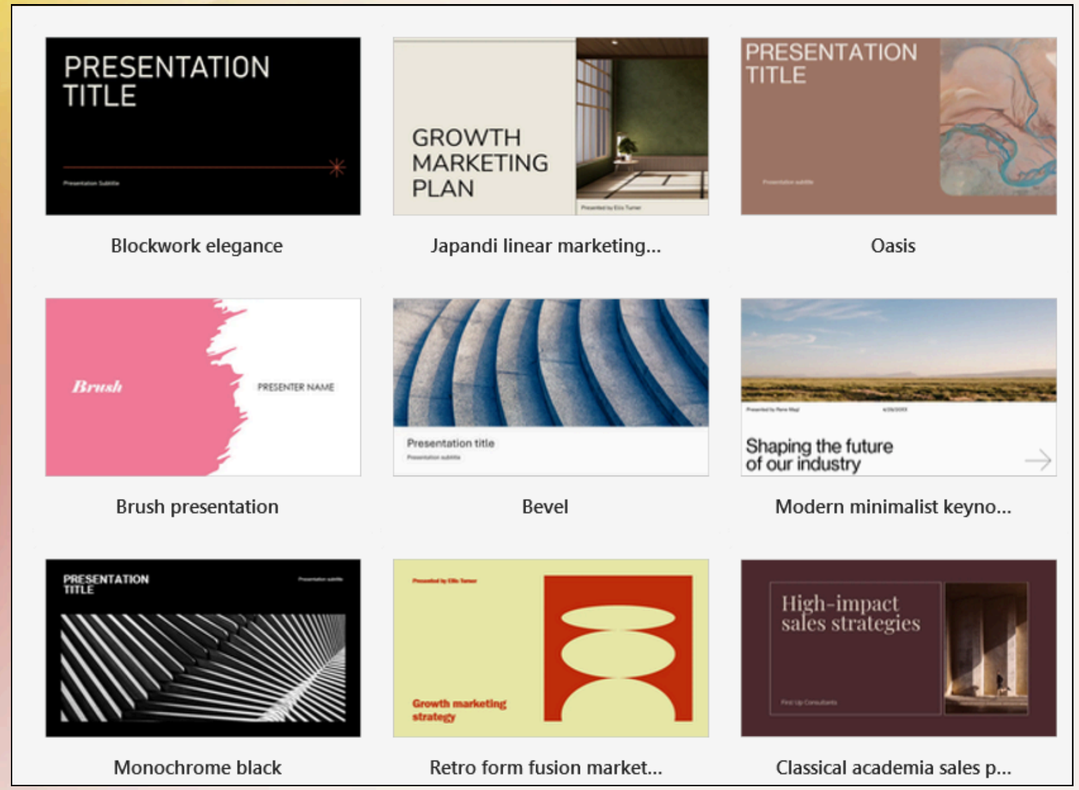

- A dedicated box below the slide area where you can type speaker notes and talking points that only you can see during a presentation

LAYOUTS

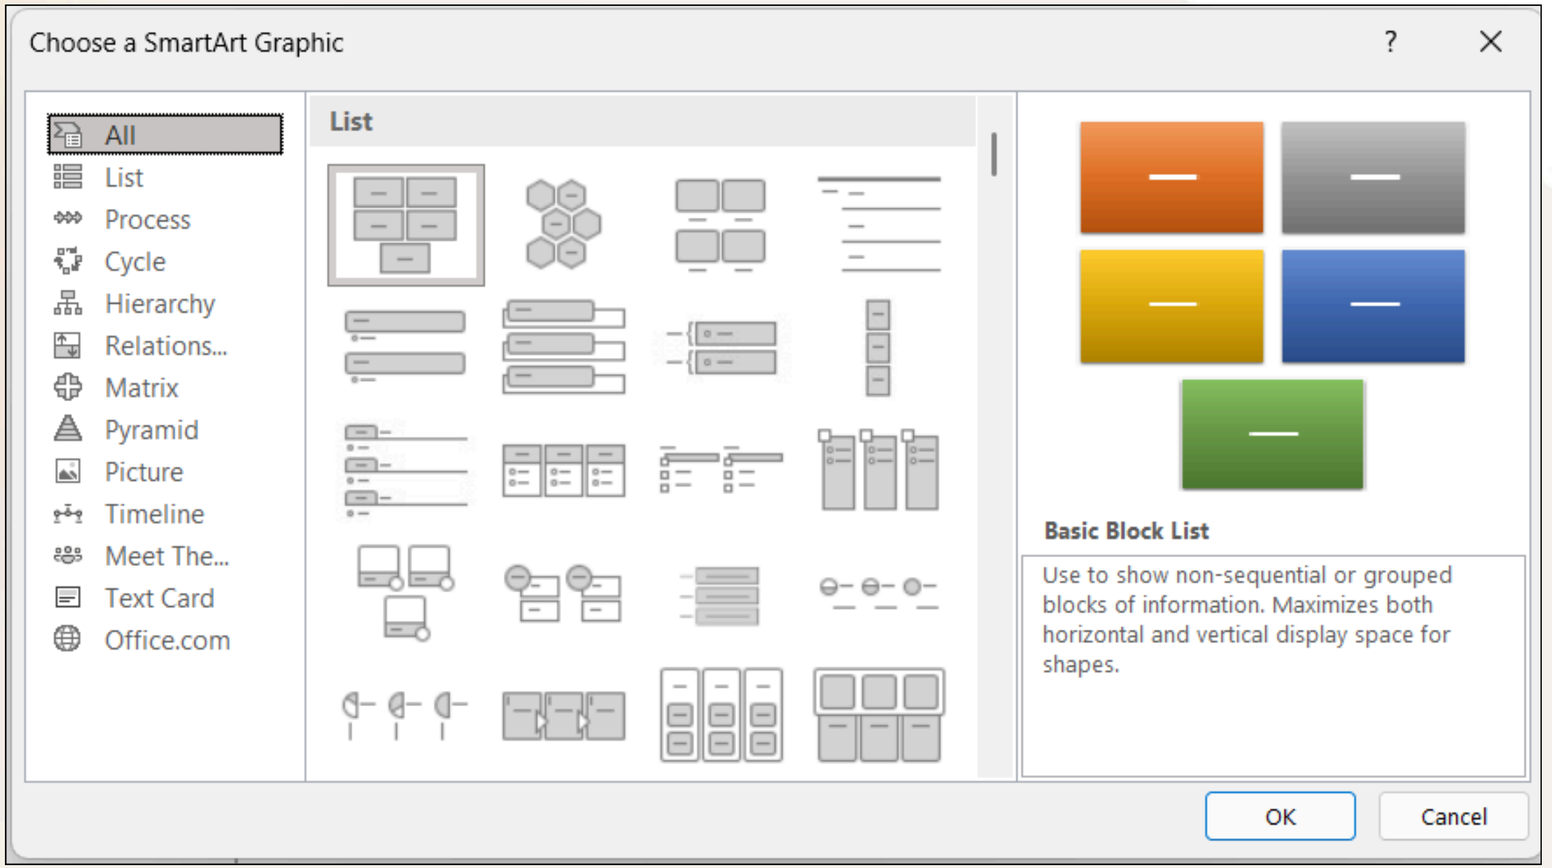

- It provide placeholders in which you can enter and edit text in formats that audiences can view and read easily, including headings, bullet and numbered lists.

TEMPLATES

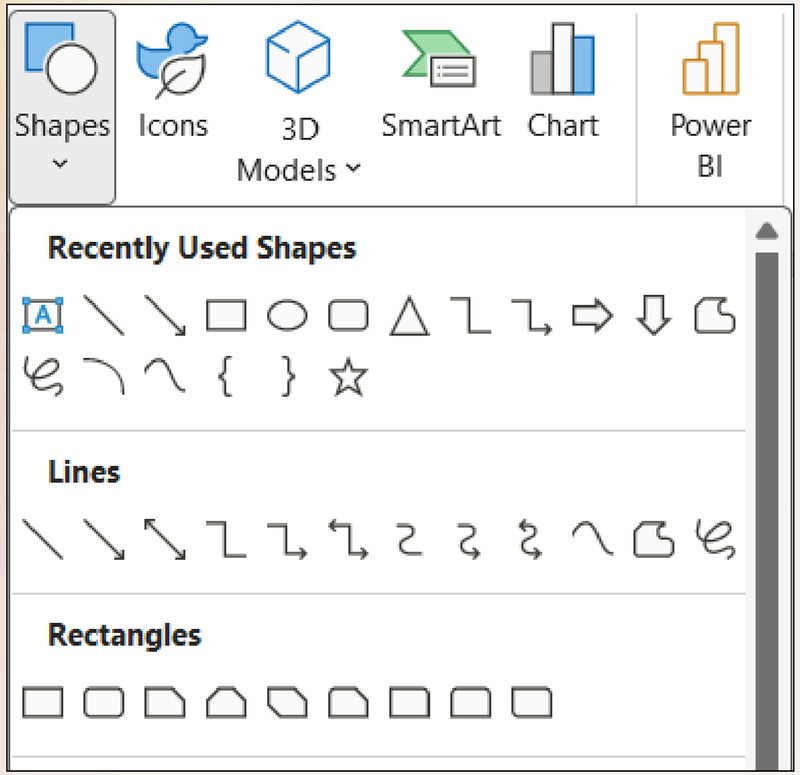

- It refers to a pre-designed slide layout that provides a consistent design and formatting style, helping users create professional-looking presentations quickly.

HYPERLINKS

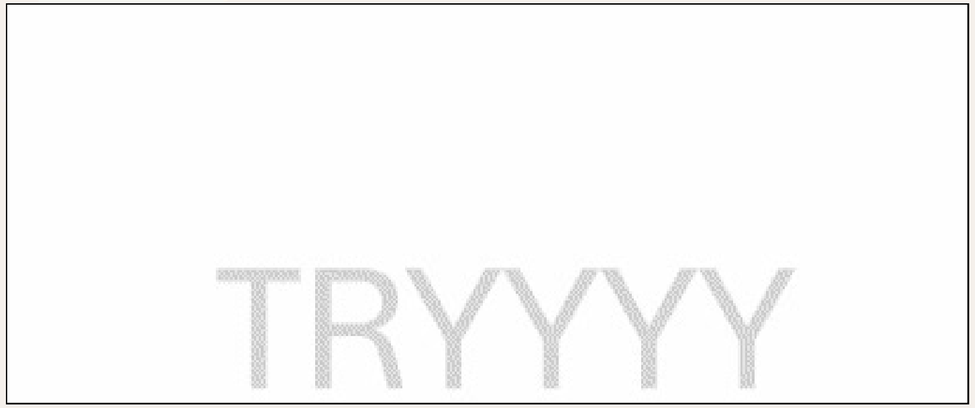

FORMATTING SLIDE TRANSITIONS

Slide transitions are settings that control how a slide is introduced as you move from one slide to another in Slide Show view

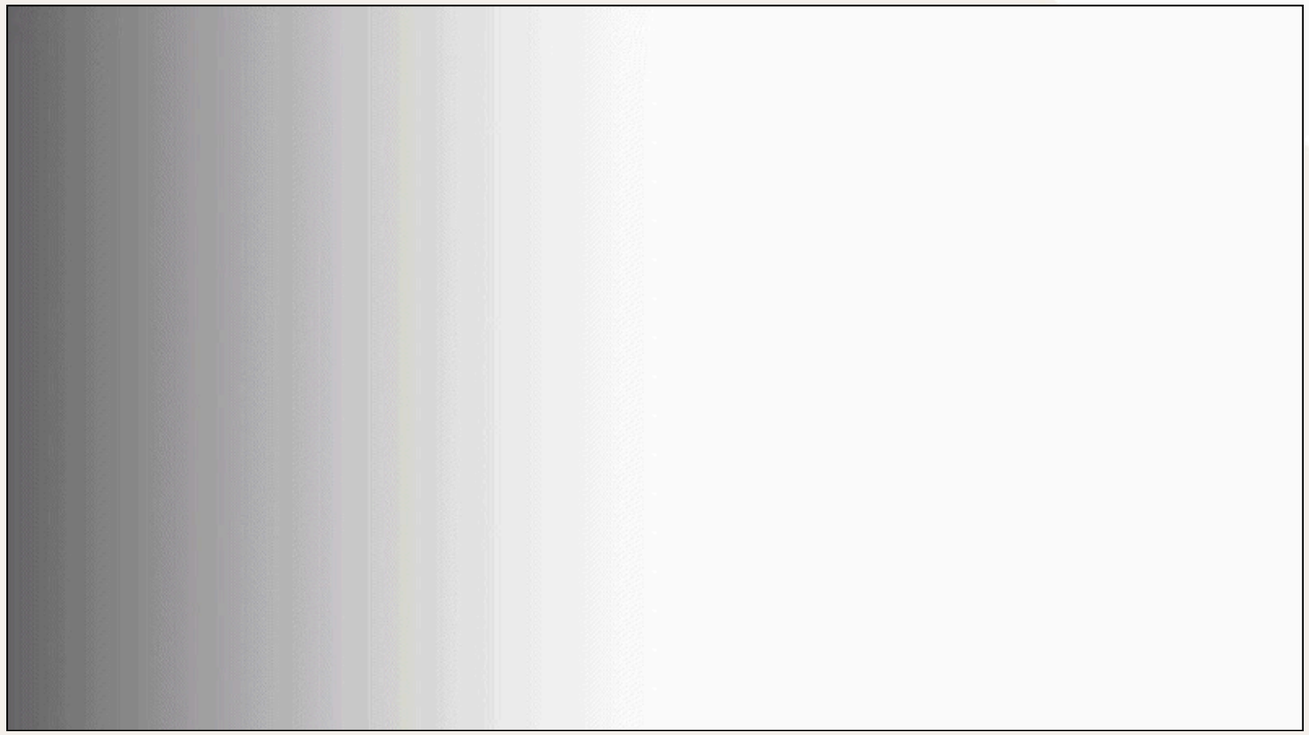

ANIMATION

- It is a visual effect applied to individual objects (like text or images) on a slide to control how they appear, move, or disappear during the presentation.

TRANSITION

It is a special effect used to move smoothly from one slide to the next during a slideshow.

CREATING NEW PRESENTATION

1. Do not overload a slide with too much content; include only essential information to keep your message clear and concise.

2. Select only one or two fonts that are easy to read, and use the same fonts for the same features in all the slides in a presentation to create a consistent appearance.

CREATING NEW PRESENTATION

3. Use numbered lists to show the steps in a process or data that should be examined in order.

4. Use bullets to present lists of information.

5. Limit the number of special features, such as bullets, numbered items, or graphics, on a single slide.

CREATING NEW PRESENTATION

6. Use graphics or charts only to highlight relevant information. Do not use graphics just to decorate a slide.

7. Tables and charts can illustrate numerical data or trends, but keep the charts simple and easy to read.
