PART I

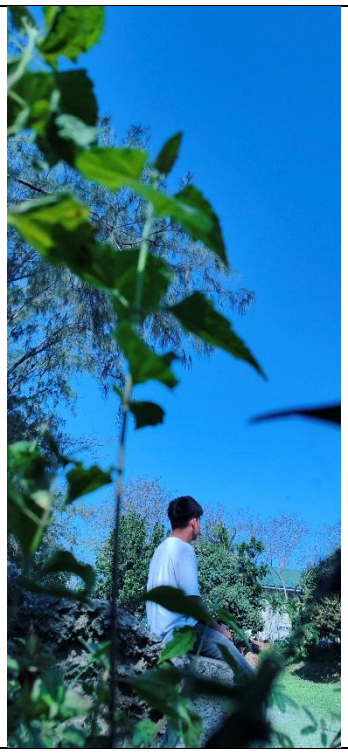

PROOF OF MANUALMODE

OUTDOOR

	**Where Footsteps Echo** POV: Worm's-eye view Composition Technique: Leading Lines Shutter Speed: 1/133s Aperture: f/1.88 Exposure Result: Proper ISO: 50 I adjusted the exposure to balance the bright natural light coming from the open side of the hallway while still keeping the subject and reflections visible. The mixed lighting of indoor shade and outdoor sunlight influenced my decision, so I maintained settings that preserved detail in both the highlights and the darker areas.

	**Where Dreams Walk the Long Way** POV: Worm's-eye view Composition Technique: Leading Lines/Symmetry Shutter Speed: 1/982s Aperture: f/1.88 Exposure Result: Proper ISO: 50 Since the photo was taken outdoors with strong sunlight coming from the sides, I adjusted the exposure to control the contrast between the bright background and the shaded walkway. The bright lighting condition influenced my decision, so I balanced the settings to keep the structure and surrounding details clearly visible without losing depth.
	**Steps Beneath the Shade** POV: Eye-level View Composition Technique: Framing Shutter Speed: 1/1548s Aperture: f/1.88 Exposure Result: Proper ISO: 50 I adjusted the exposure because the photo was taken under strong daylight, and I wanted to keep the bright areas from becoming too harsh while still showing detail in the shaded walkway. The natural sunlight influenced my decision, so I balanced the settings to maintain clear highlights and visible shadows.
	**Waiting in line** POV: Worm's-eye View Composition Technique: Leading Lines Shutter Speed: 1/1548s Aperture: f/1.88 Exposure Result: Proper ISO: 50 I adjusted the exposure because the photo was taken under strong morning sunlight, and I wanted to keep the bright sky from being overexposed while still

	showing the details of the tricycles under the shaded roof. The outdoor lighting condition influenced my decision, so I balanced the settings to maintain clear highlights and visible shadows throughout the scene.
	**Where Silence Sits** POV: Worm's-eye View Composition Technique: Framing Shutter Speed: 1/1701s Aperture: f/1.88 Exposure Result: Proper ISO: 50 I adjusted the exposure settings because the photo was taken under strong morning sunlight, and I wanted to keep the sky from becoming too bright while still showing details in the subject and surroundings. The bright outdoor lighting influenced my decision, so I balanced the exposure to maintain clear highlights and shadows without losing detail.

INDOOR

	**Still Water** POV: Eye-level Composition Technique: Leading lines Shutter Speed: 1/483s Aperture: f/1.88 Exposure Result: Underexposed ISO: 50 I adjusted the exposure to handle the strong light coming from the small window while keeping the interior details visible. The dim indoor lighting combined with the bright window influenced my decision, resulting in a slightly darker overall tone to preserve the highlights.

	**Proof of Persistence** POV: Low-angle Composition Technique: Rule of thirds Shutter Speed: 1/100s Aperture: f/1.88 Exposure Result: Proper ISO: 702 I adjusted the exposure because the photo was taken in a dim indoor setting with limited light focused on the plaque. The low lighting condition influenced my decision, so I balanced the settings to keep the text readable while maintaining the dramatic shadows around it.
	**Silent Workstations** POV: Worm's-eye View Composition Technique: Leading Lines Shutter Speed: 1/100s Aperture: f/1.88 Exposure Result: Proper exposure ISO: 175 I adjusted the exposure because the photo was taken indoors where the lighting was softer and not as strong as outdoor light. The indoor environment influenced my decision, so I balanced the settings to keep the monitors, keyboards, and background details visible without making the image too dark or grainy.
	**Between the Shelves** POV: Worm's-eye View Composition Technique: Leading Lines Shutter Speed: 1/50s Aperture: f/1.88 Exposure Result: Proper ISO: 316 I adjusted the exposure because the photo was taken indoors where the lighting was softer and slightly dim. The indoor lighting condition influenced my decision, so I balanced the settings to keep the books and subject visible while maintaining detail without making the image too dark.

	**After Class** POV: Eye Level Composition Technique: Leading lines Shutter Speed: 1/402s Aperture: f/1.88 Exposure Result: Proper ISO: 50 I adjusted the exposure because the photo was taken indoors with natural light entering from the doorway, creating contrast between the bright outside and the darker classroom. The mixed lighting influenced my decision, so I balanced the settings to keep the chairs visible while preventing the doorway from becoming too overexposed.

LOW-LIGHT SITUATIONS

	**The Outside World** POV: Side-angle Composition Technique: Leading lines Shutter Speed: 1/691s Aperture: f/1.88 Exposure Result: Slightly underexposed ISO: 50 I adjusted the exposure to emphasize the dramatic backlighting coming through the blinds while keeping the subject in silhouette. The strong light from outside influenced my decision, so I maintained a darker overall tone to preserve the highlights and enhance the contrast.

	**About you** POV: Eye-level view Composition Technique: Fill the Frame Shutter Speed: 1/50s Aperture: f/1.88 Exposure Result: Underexposed ISO: 200 I adjusted the exposure to focus on the light coming from the phone screen as the main source of illumination. The dark indoor environment influenced my decision, so I kept the overall image slightly darker to emphasize the glow on the subject's face and create a dramatic effect.
	**Hidden Beauty** POV: Eye-level close-up Composition Technique: Fill the frame Shutter Speed: 1/320s Aperture: f/1.88 Exposure Result: Underexposed ISO: 1600 I adjusted the exposure to work in a very dark environment where only a small amount of light was hitting the subject's face. The low lighting condition influenced my decision, so I allowed the image to remain dark to emphasize the mood and isolate the illuminated features.

PART II

	**BEST EXPOSED PHOTO** 1. The photo was taken outside during bright daylight. The sky was very bright, which created strong natural lighting in the scene. The subject was slightly shaded by the trees and leaves, so there was a contrast between the bright background and the softer lighting on the person. 2. I prioritized the shutter speed first because the environment was very bright. A fast shutter speed helped reduce the amount of light entering the camera and prevented the sky from becoming overexposed. After that, I kept the ISO low to maintain clear image quality. 3. The bright daylight caused slight loss of detail in the sky because I exposed properly for the subject, making the highlights a bit brighter. 4. If I were to retake the photo, I would slightly lower the exposure compensation to better preserve the highlight details in the sky.
	**MOST CHALLENGING PHOTO** 1. The photo was taken in a very low-light environment with only a small, directional light source hitting part of the subject's face. Most of the frame is in deep shadow, creating a high-contrast scene with limited available light. The lighting is uneven, with strong shadow areas and minimal highlight areas. 2. I prioritized the ISO first because the scene was extremely dark. I increased it to make the subject more visible while keeping the shutter speed fast enough to avoid motion blur and maintaining the wide aperture to gather as much light as possible. 3. The main trade-off was shadow detail. By maintaining the darkness to preserve the dramatic lighting effect, some areas of the image lost detail and became fully black. This reduced visibility in the background but strengthened the low-key mood of the photo. 4. If I were to retake the photo, I would slightly reposition the cylindrical light source closer to the subject's face to improve light control and reveal a bit more facial detail while still maintaining the dramatic low-key effect.
